Pre-Installation Preparation
Lay out the area to be edged using a garden hose or string to define the area. Then, moisten the soil around the installation area.

1. Score the ground using a spade or garden tool to create a vertical crease approximately 2" deep along the desired layout.

2. Remove edging from packaging and uncoil to straighten. Place along the prepared area with the pointed edge facing down.

3. Push or tap edging into soil using a rubber mallet. Install to desired depth, leaving up to 2" of the wall visible above grade.

4. Secure the overlapped edging with an anchoring stake. Pound the anchoring stake into the ground.

5. Backfill edging continuously to ensure straight lines, compacting both sides.

6. Typical finished installation will appear approximately 2" above grade.

HELPFUL TIPS
- Although Landshark is manufactured from recycled plastic, the points can be sharp. Gardening or work gloves are recommended when handling.

- Avoid forceful pounding, but rather lighter consistent tapping along the top edge during installation. Excessive forceful pounding may cause edging to deform.

- If having difficulty installing into the ground, make sure the soil is well saturated with water to loosen the soil.

- Installation is easiest when you make several passes along the entire length with your rubber mallet, gradually pushing the edging deeper into the soil with each pass.

Box Includes
- 1 coil of edging
- 2 anchoring stakes

Always wear safety glasses when driving stakes.

Required tools:
Spade, Mallet (Edger/trencher – optional)
